Soil Health and Intensification of Agroecosystems Mahdi M. Al-Kaisi 2017-03-15 Soil Health and Intensification of Agroecosystems examines the climate, environmental, and human effects on agroecosystems and how the existing paradigms must be revised in order to establish sustainable production. The increased demand for food and fuel exerts tremendous stress on all aspects of natural resources and the environment to satisfy an ever increasing world population, which includes the use of agriculture products for energy and other uses in addition to human and animal food. The book presents options for ecological systems that mimic the natural diversity of the ecosystem and can have significant effect as the world faces a rapidly changing and volatile climate. The book explores the introduction of sustainable agroecosystems that promote biodiversity, sustain soil health, and enhance food production as ways to help mitigate some of these adverse effects. New agroecosystems will help define a resilient system that can potentially absorb some of the extreme shifts in climate. Changing the existing cropping system paradigm to utilize natural system attributes by promoting biodiversity within production agricultural systems, such as the integration of polycultures, will also enhance ecological resiliency and will likely increase carbon sequestration. Focuses on the intensification and integration of agroecosystem and soil resiliency by presenting suggested modifications of the current cropping system paradigm Examines climate, environment, and human effects on agroecosystems Explores in depth the wide range of intercalated soil and plant interactions as they influence soil sustainability and, in particular, soil quality Presents options for ecological systems that mimic the natural diversity of the ecosystem and can have significant effect as the world faces a rapidly changing and volatile climate

Flora of Alberta E. H. Moss 1983-01-01 Since the publication of the first edition more than thirty years ago, The Flora of Alberta has become the standard guide for naturalists, botanists, and all those interested in the wildlife of the province. It provides an inventory of 1775 known vascular plant species- ferns, conifers, and flowering plants - that are native to Alberta, or if non-native, that have become established and grow wild int he province. All are grouped according to genus and family, with descriptions of species, genera, and families. Keys are provided to allow for the identification of all the known species, along with information on habitats in which species generally occur. The text for each species includes the chromosome number and indicates the geographical distribution in North America. Also included are 1158 provincial distribution maps, showing the locations of native species, and two specially prepared maps of the province - one indicating the distribution of major soil groups, the other distribution of major vegetation types. In the years since its initial publication The Flora of Alberta has been revised, updated, and considerably expanded while retaining the original format and purpose that have made it indispensable to a wide range of readers.
